

ABSTRACT OF THE DISCLOSURE

In a gantry axle for low-platform vehicles, the gantry transmission consists of one input spur gear (2) operatively connected with a first intermediate spur gear (3) non-rotatably connected with a second intermediate spur gear (4) operatively connected with an output spur gear (5). The vertical distance of the axis of rotation (10) of the input spur gear to the ground (11) is smaller than the vertical distance of the intermediate spur gears (9, 4) to the ground (11).
